

Drive System Rexroth IndraDrive

Complete, intelligent and safe

Discover the unlimited possibilities of Rexroth's automation systems. They integrate all control and drive components to provide optimum automation solutions: state-of-the-art, ultra-efficient, and highly future-proof.

Rexroth IndraDrive and Rexroth IndraDyn cause a stir in the drive market

Solve your automation challenges easily, cost-efficiently and safely with systems from Rexroth.

IndraDrive sets new standards in drive technology with a combination of three product advantages:

- Scalable in power and functionality
- Consistent in technology, engineering and operation
- Open in communication

This means that IndraDrive has numerous application advantages to offer, e.g.:

- Easy realization of frequency converter to high-end servo applications by using a common platform for open and closed loop
- Scalable range of performance and functionality thanks to the free combination of control and power components
- Wide performance range from 100 W to 630 kW
- Internationally standardized interfaces from analog input to Multi-Ethernet interface
- Integrated safety technology compliant with EN 13849-1 Cat. 3 PL d and EN 62061 SIL 2 for Safe Stop and Safe Motion
- Intelligent motion logic with PLC according to IEC 61131-3
- Uniform operating philosophy
- Consistent engineering tool
- Direct power connection
- Common DC bus for exchanging energy in multiple-axis mode
- Energy-saving power recovery
- Motors with the highest level of efficiency

IndraDrive has the power to convince

No matter what demands you make on your drive – IndraDrive offers an impressive array of key benefits:

- Integrated hardware platform
- Scalable functionality
- Unique safety concept

Safety on Board

Safety technology certified to EN 13849-1 Cat. 3 PL d and EN 62061 SIL 2, protects machine operators while the drives are in motion. In contrast to conventional safety designs, there is no longer any need for motor contactors, additional speed monitors or frequent power shutdown using the line contactor.

Integrated motion logic with IEC 61131-3 compliant PLC

Motion logic with IEC 61131-3 compliant PLC can be integrated as an optional feature that consistently applies open standards.

This makes it easier to bring in customer know-how and saves on higher-level control systems and personnel training courses.

Integrated technology functions

The technology functions can be configured on the basis of motion logic to perform a wide and diverse range of process-oriented tasks. This does not require any programming knowledge whatsoever on the user's part.

Open interfaces

Internationally recognized interfaces are available for communicating with higher-level machine control systems: sercos, PROFIBUS, Multi-Ethernet (sercos, PROFINET IO, EtherNet/IP, EtherCAT), CANopen, DeviceNet, analog and parallel.

A single software for all tasks

The engineering framework, IndraWorks, carries you through all the steps involved in project planning, programming, parameterization, operation and diagnostics.

A unique platform

In the interests of meeting your individual requirements, we have developed two versions of IndraDrive:

- IndraDrive C – compact converters
- IndraDrive M – modular inverters

Particularly economic drive solutions can be derived from the common control units and the combination of different versions.

A complete range of motors

The newly developed generation of IndraDyn motors meets all the requirements of modern factory automation through its diversity of design and unique performance:

Synchronous and asynchronous servo motors which are more compact and more powerful

Servo motors designed for potentially explosive areas – conforming to ATEX and UL/CSA

Synchronous and asynchronous motors for high-speed applications such as motor spindles

Automation

Printing and converting machines

Conveying and storage systems

Glass processing machines

Handling and assembly systems

Woodworking machines

Plastics processing machines

Semiconductor technology

Food processing and packaging machines

Textile machines

Metal forming

Machine tools

Rexroth IndraDrive – complete, intelligent and safe

IndraDrive stands for innovation all along the line.
Therefore, choosing the new drive generation from Rexroth means that your every wish will be fulfilled.

Main features of the IndraDrive:

- Compact converters and modular inverters on one platform
- Ethernet-based communications hardware with multi-protocol support
- Ultra-compact drive unit consisting of control unit and servo motor
- Integrated motion logic with IEC-compliant PLC
- Drive-integrated safety technology
- Intelligent technology functions
- Integrated engineering framework for project planning, programming, operation and diagnostics
- Complete range of synchronous and asynchronous motors

Rexroth IndraDrive – power units

Customized for the desired number of axes and power level

Wide power range – for all applications
 Converters and inverters can be combined – ideal for small axis groups
 Power supplies and inverters can be combined – ideal for large axis groups

IndraDrive C – compact converters

Power range from 1.5 kW to 630 kW with maximum current from 12 A to 1,535 A
 High overload capacity
 Compact design for single-axis applications
 Can be connected to inverters for cost-effective solutions
 Direct mains connection from 200 V to 500 V

Converters and inverters can be combined

IndraDrive M – modular inverters

Single-axis inverter with maximum current from 20 A to 350 A
 Double-axis inverter with maximum current from 12 A to 36 A
 Space-saving design for multi-axis applications
 Can be powered via power supply unit or converter
 Energy exchange via common DC bus
 Can be connected to a converter for cost-effective solutions

Power supplies and inverters can be combined

IndraDrive M – modular power supplies

Power range from 15 kW to 120 kW
 Direct mains connection from 400 V to 480 V
 Energy-saving line regeneration
 Integrated mains contactor
 Integrated brake resistor

IndraDrive – the clever combination of power units

Single-axis solution with a converter

The IndraDrive C series of converters integrate inverter and power supply in one unit. The compact construction contains additional mains connection components, making it particularly suitable for single-axis applications.

Multi-axis solution with converters and inverters

A combination of IndraDrive C converters and modular IndraDrive M inverters is a particularly cost-effective solution for small axis groups.

The converter for the first axis supplies the inverters of the other axes at the same time. In this case, a converter with sufficient power reserve must be selected in order to be able to supply the smaller inverters as well.

Multi-axis solution with power supplies and inverters

Multi-axis applications are the domain of the modular system IndraDrive M. Power supplies provide the necessary DC bus voltage for the inverters. Compact single-axis or double-axis inverters and power supplies with integrated mains connection components enable compact solutions for large axis groups.

Maximum energy efficiency can be achieved with power supplies that are capable of mains regeneration. Beside the power recovery encountered in regenerative operation of the drives, these devices also feature sinusoidal line currents, an overall power factor of 0.99 and a closed-loop DC bus.

Derating under differing operating conditions

Where installation conditions differ, the performance data of the power units decrease according to the capacity utilization factors for:

- Continuous current
- DC bus continuous output
- Permanent braking power

Compared with operation at 4 kHz switching frequency, the output currents of the power units decrease at higher switching frequencies. Please refer to these diagrams for the capacity utilization factors relevant for your application.

Rexroth IndraDrive – control units

Scalable performance and functionality

Individual solutions for standard to high-end applications
 Integrated motion logic with innovative technology functions
 Open interfaces for international use
 Certified safety technology

We can supply control units tailored to your specific application, ranging from standard to high-end applications. Integrated motion logic, numerous technology functions, certified safety technology and standardized interfaces leave nothing to be desired.

BASIC control units – standard performance and functionality

These control units constitute the economic solution for all standard applications with moderate requirements in terms of performance and interface flexibility. A standard encoder interface for IndraDyn motors is already featured among the BASIC control units. The BASIC UNIVERSAL control units have an additional extension slot available.

The following BASIC control units are available to choose from:

- BASIC OPEN LOOP
- BASIC ANALOG
- BASIC PROFIBUS
- BASIC SERCOS
- BASIC UNIVERSAL – single-axis
- BASIC UNIVERSAL – double-axis

ADVANCED control units – maximum flexibility and performance

These control units meet the highest requirements in terms of performance. Virtually any application can be tackled with the wide range of communication and encoder interfaces as well as analog or digital inputs and outputs.

IndraDrive – tailored performance and functionality

All IndraDrive control units – from the simple frequency converter to the high-end servo drive with integrated motion control – are compatible with all IndraDrive C converters and IndraDrive M inverters.

The control units differ in performance, function and configuration. When combined with the various firmware versions and operating panels, every conceivable requirement can be met. This flexible system concept opens up the full range of options when it comes to tackling your individual application – always providing the optimum technical and economical solution.

BASIC OPEN LOOP – for applications without an encoder

This control unit is specifically designed for frequency converter applications without an encoder.

The target speed can be set via analog or digital inputs.

Status signals and diagnostic messages are output via digital outputs or isolated relay contacts.

For an easy start-up, use the VCP 01 standard operator panel or a PC with the Rexroth IndraWorks software.

1 Interfaces Digital inputs and outputs Analog inputs and outputs	3 Interfaces Analog inputs and outputs	5 Operator panel Standard operator panel
2 Interfaces Relay outputs	4 Serial interface RS232

BASIC ANALOG – proven technology, cost-effective

This control component allows you to enjoy the many benefits of digital drive technology on controls with the conventional ± 10 V analog interface. In addition, it gives you the added option of expanding your control equipment at any time to include other communication interfaces by exchanging the control component while retaining the control cabinet setup.

The default speed is set via the analog input. Signals, such as “Control enable” or “Drive stop”, are exchanged by the control system and control unit via digital inputs and outputs. The encoder emulation inside the drive systematizes the actual positions for the control system. There is a choice between the straightforward incremental encoder signal or SSI format.

The correct interface for connecting the IndraDyn motors or other standardized encoders, such as Hiperface®, is already integrated.

BASIC PROFIBUS – ideal for factory automation

The PROFIBUS fieldbus interface has been used successfully for many years in automated manufacturing technology and process automation.

This bus system is the means by which the control system cyclically exchanges with the bus users all the specified and actual values, including status signals and diagnostic messages. The correct interface for connecting the IndraDyn motors or other standardized encoders, such as Hiperface®, is already integrated.

Start-up with the IndraWorks engineering tool is a convenient option via PROFIBUS.

BASIC SERCOS – precise and cost-effective

Only sercos II¹⁾ lets you enjoy all the advantages of digital intelligent drive technology. One distinguishing feature of sercos II is its extremely short cycle time required for the transfer of all target and actual values between the control system and control units. In conjunction with the exact synchronization of all drives, sercos II guarantees maximum dynamics and precision.

Signal transfer via fiber optics guarantees the secure exchange of real-time data with minimal wiring.

The correct interface for connecting the IndraDyn motors or other standardized encoders, such as Hiperface®, is already integrated.

With the engineering tool, IndraWorks, one convenient start-up option is via the sercos service channel and the other is via the RS232 interface.

¹⁾ sercos II, the internationally standardized drive interface (IEC 61491/EN 61491), facilitates optimum compatibility of digital drives and controls made by different manufacturers while exploiting the respective product attributes to maximum effect.

BASIC UNIVERSAL single-axis – flexible for customized solutions

Regardless of your preferred type of control communication, BASIC UNIVERSAL offers you a wide range of industry-standard interfaces. As a result, this control unit is well suited for a variety of applications – including those in your industry.

The correct interface for connecting the IndraDyn motors or other standardized encoders, such as Hiperface®, is already integrated. In addition, this control unit has an empty slot for the connection of another encoder, connection of the analog I/O extension or for the emission of emulated encoder signals.

An additional plug-in MultiMediaCard gives you the option of simple transmission or duplication of your drive parameters. This card can also be used to expand the memory for the motion logic integrated in the drive (firmware option).

For an easy start-up use a PC with the Rexroth IndraWorks software.

BASIC UNIVERSAL double-axis – flexible, safe, space-saving

Many axes and limited installation space – these are typical requirements that can be met competently and economically with the BASIC UNIVERSAL double-axis control unit. With the BASIC UNIVERSAL double-axis, we have implemented all the functionality for two digital axes in a single control unit.

With certified safety technology conforming to EN 13849-1 and EN 62061, you are providing effective protection for both the machine and operator. Indeed, we have integrated a number of different safety functions, directly in the drive. This increases reliability while saving on monitoring components and minimizing installation work. In terms of control communication you can choose between sercos II, PROFIBUS, sercos III and Multi-Ethernet. In the interests of meeting the specific demands of your individual application, IndraDrive offers additional options for the connection of various encoder systems, the connection of an analog I/O extension or for the emission of emulated encoder signals. The double-axis control unit offers the ability of storing the axis-oriented drive parameters of both axes on the optional MultiMediaCard.

ADVANCED – the security of maximum performance and flexibility

ADVANCED control units meet the highest demands in performance and dynamics. In addition to top performance, they support a wide and diverse range of control communication and encoder interfaces. Digital and analog inputs and outputs are already permanently integrated for communication with higher level control systems. These can also be expanded by digital or analog I/O extensions or by encoder emulation outputs. This high-performance control unit can be optionally equipped with safety technology certified as conforming to EN 13849-1 and EN 62061. The ADVANCED control unit is the ideal platform for the drive-integrated PLC, IndraMotion MLD. All that is required to start up the drive is a PC and the engineering tool IndraWorks.

Accessories – add-ons for your control unit

These components can help you to capitalize on your drive – during start-up, operation and diagnostics.

Operator panel

All control units are equipped with a standard plug-in operating panel. This will guide you quickly and confidently through all the start-up steps – no PC is required.

Separate control terminals

For complex applications, especially in conjunction with the drive-integrated motion logic, we recommend the use of our compact control terminals IndraControl VCP.

Connection is via the drive's serial interface.

From the simple text display right through to the graphics-capable touch screen, they always provide a particularly cost-effective solution for operation and visualization.

For more detailed information, please refer to the product catalog “Automation Systems and Control Components” (R911320438).

Software module

The optional MultiMediaCard allows you to transmit or duplicate your axis-oriented drive parameters quickly and easily – without a PC.

This software module comes in two versions:

- PFM02.1-016-NN-FW with drive firmware
- PFM02.1-016-NN-NW preformatted for simple parameter transfer

Interface cable

For start-up or operation connect your PC or a separate control terminal directly to the RS232 serial interface of the control unit.

The pre-assembled PC interface cable IKB0041 is available in lengths of 2, 5, 10 or 15 m.

The RKB0004 operator terminal cable is available in lengths of 2, 5 and 10 m.

IndraDrive Cs – compact multi-protocol drive system

Highly versatile, extremely compact drives

- Power range from 100 W to 9 kW
- Ethernet-based communications, multi-protocol support
- Innovative multi-encoder interface
- Extremely compact design

**IndraDrive Cs – compact drives featuring Ethernet-based communications**

The IndraDrive Cs offers new communications hardware with multi-protocol support which addresses today's increased need for open, seamless design.

The drives support SERCOS III, PROFINET IO, EtherNet/IP and EtherCat. Connectivity via these Ethernet-based interfaces is provided by software-configurable communications hardware. Alternatively IndraDrive Cs can also be supplied with a conventional communications interface, for example PROFIBUS. The Rexroth solution gives users maximum communications flexibility with minimum engineering effort.

These impressive features plus the new multi-encoder interface which supports all standard encoder types plus an additional option slot make the IndraDrive Cs the ideal choice for highly specialized drive applications. IEC-compliant motion logic and industry-specific technology function support a very wide range of applications.

IndraDrive Cs – universal, intelligent and cost-effective

In addition to compact design and highly impressive performance specifications, the IndraDrive Cs offers a comprehensive portfolio of Ethernet-based communications interfaces.

The new communications interface supports a whole range of protocols. The IndraDrive Cs will run with a broad spectrum of Ethernet-based communications protocols without any hardware modifications.

IndraDrive Cs is compatible with the most common encoder types. This is a standard feature of the drives, and it means that you have complete freedom to choose the best motor/encoder system for your application.

¹⁾ Single-phase power supply possible, derating with HCS01.1E-W0013 and -W0018

Technical features

- 2 series for direct connection to 110 – 230 V AC or 200 – 500 V AC
- Suitable for motors with continuous outputs of 0.05 to 9 kW
- Complete range of scalable drives
- Compatible with the IndraDrive family
- Digital inputs/outputs and analog input on board
- Intelligent operating panel with programming module function, supports device swap without a PC

- IEC-compliant motion logic IndraMotion MLD (optional)
- Integrated safety technology STO (Safe Torque Off) compliant with EN 13849-1 Cat. 4 PL e and EN 62061 SIL 3
- Integrated brake resistor; external brake resistor can be connected as an alternative

IndraDrive Mi – distributed drive system

Compact and economically efficient

- Maximum torques of up to 35 Nm
- Flexible extension options
- Easy project planning
- Less wiring
- Smaller control cabinet size

Distributed servo drive KSM

With KSM, the distributed servo drive series of IndraDrive Mi, Rexroth introduces another milestone in drive technology – electronic control system and servo motor combined in one ultra-compact unit.

This makes IndraDrive Mi the ideal solution for all applications where maximum flexibility and economic efficiency should come along with minimum space requirements.

In addition to its compact design, KSM combines the best characteristics of an IndraDrive and MSK servo motor – from the drive-integrated PLC according to IEC 61131-3 up to protection category IP65.

Distributed drive controller KMS

The distributed drive controller KMS, in protection category IP65, provides seamless integration of IndraDyn servo motors and 3rd party motors into a chain of IndraDrive Mi drives.

Electronic control system KCU

The electronic control system KCU allows all required connections for a daisy chain of up to 20 IndraDrive Mi – this reduces the installation workload to a minimum.

Accessories

- Hybrid cable – for communication and power supply
- Terminal connector – for terminating the drive chain
- Interface cable – for connection to a PC
- I/O cable – for linking digital I/O signals
- Software module – for data transfer without a PC

IndraDrive Mi – distributed servo drive KSM

The compact control electronics of the distributed servo drive KSM uses the lateral surface of the servo motor as a cooling element. This reduces the total unit size by more than 50% compared to classical servo drive solutions and by up to 30% compared to other integrated solutions.

Another advantage of IndraDrive Mi is the significantly reduced installation work – a single cable is sufficient for power supply and communication via sercos II.

The distributed drive controller KMS enables users to seamlessly integrate a wide range of motors into an IndraDrive Mi drive chain.

It is the solution of choice when:

MSK030 servo motors, which due to their size are not suitable for IndraDrive Mi, need to be integrated into a chain of drives

MSK servo motors need to be installed, because space constraints preclude the use of motor-integrated KSM inverters

Additional 3rd-party motors in open-loop mode or with Hiperface® encoders need to be attached

As is the case with KSM distributed servo drives, a hybrid communications/power cable is used to connect the drives.

The simple step-by-step guide to ordering your distributed drive controller KMS:

All data refer to the operation with 750 V DC bus voltage

All advantages at a glance

Seamless connectivity of IndraDyn servo motors to the chain of drives; the benefits of IndraDrive Mi technology are retained even when space is at a premium
Simple integration of 3rd-party motors

Machines/systems are significantly more flexible and modular

IndraDrive Mi – electronic control system KCU

In addition to its function as a signal converter for sercos II, the compact electronic control system KCU allows all necessary connections to the IndraDrive Mi at a common coupling:

- Conversion of sercos II from the fiber optics cable to RS422
- Routing of the power supply from the DC bus of an IndraDrive converter or supply unit
- Exchange of status and diagnostic messages between IndraDrive Mi and supply unit
- Supply of control voltage to the IndraDrive Mi
- Protection of the DC bus connection with integrated fuses

Up to 20 IndraDrive Mi units can be flexibly connected in series in one drive chain – without any modifications to the cabinet.

If required, it is also possible to connect a number of KCU electronic control systems to a single supply unit in order to operate several IndraDrive Mi drive chains in parallel.

IndraDrive Mi – accessories

Hybrid cable RKH and terminal connector RHS

The significant reduction of installation work is one of the big advantages of the IndraDrive Mi – a single cable is sufficient for power supply and communication via sercos II.

The hybrid cable RKH is supplied pre-assembled with plug-in connectors. Coded connectors ensure that the hybrid cable is connected with the correct polarity. From the wide range of connecting cables, select the suitable outgoing direction for your application.

Each cable with one or several IndraDrive Mi is terminated with a terminal connector RHS0004.

Interface cable

For start-up or operation, connect your PC directly to the serial interface of the IndraDrive Mi. The cable RKB0006 is available pre-assembled with a length of 5 m.

For linking digital I/O signals to the IndraDrive Mi, use the pre-assembled cable RSK0010 with a length of 5 m.

Software module¹⁾

The MultiMediaCard provides an easy transmission or duplication of your drive parameters – without a PC.

¹⁾ Included in the delivery

Rexroth IndraMotion MLD – integrated motion logic

The world's first open drive

With IndraMotion MLD drive functions, motion control and processing logic merge to form a modern open automation platform for modular machine concepts. The drive-integrated motion logic reduces or even eliminates the need for higher-level control systems.

Open standards

Standardized programming languages and the integrated engineering framework IndraWorks simplify project planning, programming, operation and diagnostics. At the same time you are directly investing your valuable know-how in the drive and thereby safeguarding your competitive edge.

Programming is in compliance with IEC 61131-3 in the following languages:

- Instruction list (IL)
- Structured text (ST)
- Functional block diagram (FBD)
- Ladder diagram (LD)
- Sequential function chart (SFC)
- Continuous function chart (CFC)

The availability of standardized modules in the PLCopen-compliant function library gives you access to a multitude of motion functions.

Flexible programming

With user-definable programming you have the freedom and flexibility to configure your application to your requirements. Indeed, you have the latitude to combine innovative drive functions, extensive function libraries and process-oriented technology packages into one perfect automation solution.

Achieve your goals faster

Even large-scale and complex applications can be handled with ease with our ready-to-use function blocks and predefined technology packages. Combine them to form your own user program or simply use them as configurable functions.

Examples of items:

- PLCopen modules
- Programmable limit switch
- Print-mark control
- Register control
- Tension control
- Loop control
- Winder
- Demand processing

Extended drive functions:

- Variable retraction motion
- Adaptive feedrate control
- Analog force control and much more

Selected IndraMotion MLD function blocks and function libraries are available on DVD together with IndraWorks MLD, the simple, intuitive engineering tool for IndraDrive.

Order code:

SWA-IWORK-MLD-xxVRS-D0-DVD**-COPY

Innovative modules for any application

Function library: Collection of function blocks conforming to IEC or PLCopen

User library: Collection of function blocks developed by the user

Technology packages: Process-oriented function blocks, e.g. tension control

User program: Application-specific combination of different function blocks and technology packages

Drive and control system seamlessly coordinated

Highly-economic solution for single-axis and multi-axis applications without additional hardware
 Minimized engineering thanks to IEC- and PLCopen-compliant project planning
 Predefined technology packages for faster implementation

Safety on Board – integrated safety technology

Whether for machine tools, printing and packaging or mounting, handling and robotics applications – protecting people from uncontrolled machine movements is top priority.

Clear guidelines issued by the EU

All machine manufacturers are obliged to carry out a hazard evaluation and risk analysis prior to construction. This is stipulated in the European Machinery Directive 2006/42/EC. Moreover, any potential hazards detected must be eliminated step by step. Safety should be integrated in the machinery and meet current standards in technology.

How safe can you get?

IndraDrive is redefining current standards in technology because IndraDrive integrates the safety directly in the drive, resulting in ultra-short response times. IndraDrive therefore demonstrates the current capacities and requirements of safety technology – IndraDrive is faster because the movement is monitored directly where it is generated. This is the critical advantage, especially when it comes to monitoring direct drives or other high-dynamic drives, for example.

Quickest response times with highest drive dynamics

With the new IndraDrive generation from Rexroth, a variety of safety functions are available right inside the drive – without any detours through the control. This increases reliability, saves on additional monitoring components and reduces installation cost and effort.

It is all made possible by redundant software and hardware components in the drive. The non-contacting monitoring of all set limit values enables very short response times of less than 2 ms. As soon as an error is detected, all the drives are automatically stopped depending on the stop category selected (0, 1 or 2).

Before a user in the protected area reacts to an error with an acknowledgement linked to contacts, a linear axis with a ball screw has already traveled 100 to 200 mm, linear motors have already traveled 400 to 800 mm. IndraDrive safety technology finds the error within 2 ms and the axis moves only 2 mm.

Safety functions inside the drive effectively protect people and machines

High reliability due to certified integrated safety functions

Extremely fast response times (< 2 ms) for fault detection by internal monitors

No need for additional measuring systems or sensors

Online dynamic sampling of the inputs and shutoff paths while work is in progress

PROFIsafe interface with reduced configuration and installation effort and safe, distributed I/Os

Reduced certification effort and short series start-up times

**SAFETY
ON
BOARD**

Intelligent and safe

Safety category 3, PL d, SIL 2
 Extensive safety functions
 Minimum response times
 Independent of the control system
 Straightforward integration in the machine

Safe Torque Off (STO)

Stop category 0 in accordance with ICE 60204-1:
 Safe drive torque cut off

Safe Stop 1 (SS1)

Stop category 1 in accordance with ICE 60204-1:
 Safely monitored stop, control or drive controlled with safe drive torque cut off

Safe Stop 2, Safe Operating Stop (SS2, SOS)

Stop category 2 in accordance with ICE 60204-1:
 Safely monitored stop with safely monitored standstill at controlled torque

Safely Limited Speed (SLS)

If enable signal is given, a safely limited speed is monitored in special operating mode

Safe Direction (SDI)

A safe direction (clockwise, counterclockwise) is also monitored in addition to safe motion

Safely Monitored Position (SMP)

A safely limited position range is also monitored in addition to safe motion

Safe Inputs/Outputs (SIO)

Dual-channel safety peripherals can be connected to the drive and made available to the controller via the safety bus

Safe Maximum Speed (SMS)

The maximum speed is safely monitored irrespective of the mode of operation

Safe Braking and Holding System (SBS)

The safe braking and holding system controls and monitors two independent brakes

Safe Door Locking (SDL)

When all the drives in one protection zone are in safe status, the safety door lock is released

Safely Limited Increment (SLI)

If enable signal is given, a safely limited increment is monitored in special operating mode

Safely Monitored Deceleration (SMD)

Safely monitored deceleration ramp when stopping with predetermining characteristics

Safely Limited Position (SLP)

Monitoring of safe software limit switches

Safe Communication

Safe Communication (SCO)

Selection/deselection of safety functions and transfer of process data (e.g. actual position values) via safety bus

All safety functions are certified as compliant with the standards EN ISO 13849-1:2006, EN 61800-5-2:2007, IEC 61508:1998-2000, EN 62061, ISO 13849-1:1999, EN 954-1:1996, EN ISO 13849-2:2003, EN 60204-1:1997, EN 50178-1:1997, EN 61800-3:2004, UL 508C R7.03, C22.2 No. 0.8-M86 (R2003), CAN/CSA C22.2 No. 14-95, NFPA 79:2007 ER1 through TÜV Rheinland and TÜV Rheinland North America Inc.

Safety on Board – be on the safe side

Safe Torque Off (STO)

The STO option is the most cost-effective solution for preventing the drive from restarting unintentionally. The power supply is cut off electronically on two channels. The STO option is activated via two redundant 24 V signals. This function can be selected with all control units except BASIC OPEN LOOP.

Safe Motion

The ADVANCED and BASIC UNIVERSAL double-axis control units offer you all the available safety functions – including safe motion and safe absolute position.

This safety is guaranteed by two redundant, diverse processor systems which carry out all the relevant calculations separately and monitor each other. The two-channel selection of the required safety function can be executed differently.

Rexroth IndraWorks – one tool for all engineering tasks

Simple and user-friendly, Rexroth IndraWorks is the ideal engineering environment for all Rexroth electrical control and drive systems. This engineering framework brings together in one integrated interface all the tools required for:

- Configuration
- Programming
- Parameterization
- Operation
- Visualization
- Diagnostics

Advantages

- Integrated software framework for all engineering tasks
- Application-oriented tools
- Intelligent user guidance
- User-friendly, menu-driven operation
- Standardized programming according to IEC 61131-3
- PLCopen-compliant module library
- Open-architecture through integrated FDT/DTM technology
- Cutting-edge Microsoft .NET technology

IndraWorks for IndraDrive is available on DVD:

- IndraWorks D – for drive engineering
SWA-IWORKS-D**-xxVRS-D0-DVD**-COPY
- IndraWorks MLD – also includes support for
IndraMotion MLD
SWA-IWORKS-MLD-xxVRS-D0-DVD**-COPY

You receive a simple, connection-based service tool along with IndraWorks D and MLD:

- IndraWorks Ds – for service and commissioning of single drives (part of IndraWorks D and IndraWorks MLD, available on the Internet or as a separate DVD)
SWA-IWORKS-DS*-xxVRS-D0-DVD**-COPY

IndraWorks D and IndraWorks MLD can be combined with the CamBuilder cam editor:

- CamBuilder SWS-IWORKS-CAM-xxVRS-D0

Rexroth IndraWorks – the integrated engineering framework for project planning, programming, parameterization, operation and monitoring

IndraWorks – the universal engineering framework

- One tool for all automation tasks
- Guided start-up for rapid achievement of results
- Offline configuration of projects
- User-friendly programming environment

Start-up wizard

IndraWorks interactively guides you through all the steps of the startup process and only requires you to input the relevant data. All values to be input are directly related to the mechanics of the machine. This simplifies the input of data, along with allowing you to freely select measurement units.

You individually assemble the required sequence of movements from a large selection of positioning modes presented in graphic form. Once compiled, the set of parameters is saved in a file and can be easily transmitted to other machines via fieldbus or the RS232 serial interface.

Programming

All functionality and programming modes according to IEC 61131-3 are available for the drive-integrated PLC.

With PLCopen function blocks, you can quickly and transparently integrate drive functionality into your PLC program.

Integrated technology functions
The configurable motion logic-based technology functions allow you to perform the full range of different process-oriented tasks – and require no programming skills.

Auto-tuning

Parameters for all internal control functions are automatically set when IndraDyn motors are connected.

This setting is ideal for the majority of applications, requiring no further adjustment. Where requirements are more complex, the auto-tuning function is available to assist with adjusting the control settings to your machine.

Offline mode

The machine-related modes of operation and the corresponding parameters can be set in advance offline and later transferred to the machine.

Four-channel oscilloscope

The integrated four-channel oscilloscope is available to assist with drive optimization, troubleshooting and preventive maintenance. For documentation purposes all the measurements and the related settings can be printed out or saved to a file.

CamBuilder (optional)

Rexroth CamBuilder is a graphics-based software tool for the convenient creation of electronic cams. With a few inputs, you can implement various applications easily and quickly. The established cams are directly transferable to Rexroth drives and controls.

Rexroth IndraSize – rapid and safe sizing

IndraSize – the user-friendly program for drive sizing – is the quickest way to find the optimum drive for your machine. Regardless of whether you are using a conventional servo axis or direct drive, IndraSize allows you to define the ideal motor/drive combination in a few steps.

Mechanics

IndraSize is compatible with all standard drive mechanisms such as:

- Ball screw with rotating screw
- Ball screw with rotating nut
- Rack and pinion
- Belt and pulley
- Linear direct drive
- Rotary drive
- Roller
- Rotary knife
- Winder/unwinder
- Roll feed

With the aid of graphics you simply simulate your machine kinematics, combining the motor and the selected mechanical parts with the various transfer units:

- Coupling
- Belt drive
- Gears

Any number of these can be combined in any order.

Motion profile

With IndraSize you can freely compile a full motion profile from individual sequences of movements. If applicable, you may use higher-order equations of motion as e.g. polynomials or sinoids. Alternatively, import pre-assembled cams generated with the CamBuilder.

Moreover, IndraSize allows you to define typical applications very simply by inputting parameters. Applications can be configured in next to no time, such as:

- Roll feeds
- Flying cutoff
- Winders
- Cross cutters

Download

IndraSize can be downloaded from the Internet at:

and much more

Five steps to your drive solution

Regardless of whether you want to tackle a simple or complex drive task – whatever the case, IndraSize will lead you confidently through just five steps to success. Let the menu take you through the individual program steps from

selecting the mechanical system and associated motion profile right through to the point where you are presented with the optimum motor/drive combination together with a table or curve showing its performance data.

Step 1:

Select mechanical system and motion profile

Step 2:

Input mechanical and link element data

Step 3:

Define the motion cycle

Step 4:

Select the drive from the filtered list generated

Step 5:

Check and save drive details

Rexroth IndraDyn – motors and gearboxes

A powerful family

Extensive range including robust housed and high-speed motors
 Coverage of entire power range
 High-precision encoder systems
 Highly-dynamic synchronous linear motors
 Special hazardous duty designs conf. to ATEX or UL/CSA

IndraDyn S

Synchronous servo motors MSK with maximum torque of 495 Nm
 Synchronous servo motors MKE with explosion-proof enclosure for potentially explosive atmospheres up to 187 Nm
 Ultra-compact synchronous servo motors MSM rated at up to 7.1 Nm can be connected to the IndraDrive Cs

IndraDyn A

Air-cooled asynchronous servo motors MAD with power ratings up to 93 kW
 Liquid-cooled asynchronous servo motors MAF with power ratings up to 120 kW

IndraDyn L

Synchronous ironcore linear motors MLF for feeding forces of up to 21,500 N
 Synchronous ironless linear motors MCL with maximum speeds of up to 1,400 m/min

IndraDyn T

Synchronous torque motors MBT with torque ratings up to 13,800 Nm and speeds of up to 4,000 rpm

IndraDyn H

Synchronous high-speed motors MBS for speeds of up to 22,500 rpm and maximum torques of up to 4,500 Nm

1 MB

Asynchronous high-speed motors for speeds of up to 20,000 rpm and rated torques of up to 875 Nm

Servo gearboxes

Standard planetary gearboxes GTE
 High-precision planetary gearboxes GTM

Standard and geared motors

Wide range of motors made by well-known manufacturers for combining with IndraDrive

IndraDyn S – MSK synchronous servo motors

The particularly outstanding features of the MSK range of motors are its wide power spectrum and narrow size increments. The high torque density of these synchronous servo motors allows a particularly compact design with maximum torques of up to 495 Nm.

Depending on the level of precision required, we can supply the motors with encoder systems with a low, medium, or high resolution. All encoder versions are available in a single-turn and multi-turn configuration.

A number of further options, such as the shaft keyway, holding brake, reduced runout and the high protection category IP65 mean that they can be used in virtually any application.

On applications with high levels of continuous power, optional fan units for axial or radial mounting are available for retrofit. Self-protected IP65 fan motors (UL thermally protected F) ensure the reliability of the single-phase fan units, eliminating the need for an external circuit breaker. Optional liquid cooling is available for very high power applications.

Compact and powerful

Maximum torques up to 495 Nm
 Maximum speeds up to 9,000 rpm
 Encoder systems for a wide and diverse range of applications
 High protection category IP65
 Choice of cooling systems

The simple step-by-step guide to ordering your MSK servo motor:

MSK060C-0600-NN-S1-UG0-NN NN

Motor

Overall size (e.g. "060")
 Overall length (e.g. "C")
 Winding (e.g. "0600")

Cooling system

NN = Natural convection

Surface cooling or liquid cooling optional for certain sizes

Encoder

S1 = Single-turn encoder (Hiperface®), 128 signal periods
M1 = Multi-turn encoder (Hiperface®), 128 signal periods with 4,096 revolutions absolute
S2²⁾ = Single-turn encoder (EnDat), 2,048 signal periods
M2²⁾ = Single-turn encoder (EnDat) 2,048 signal periods
S3 = Single-turn encoder (Hiperface®), 16 signal periods
M3 = Multi-turn encoder (Hiperface®), 16 signal periods with 4,096 revolutions absolute

²⁾ From size MSK040...

Shaft

G = Plain shaft with shaft sealing ring
P = Keyway conforming to DIN 6885-1 and shaft sealing ring

Other versions

N = Standard

S¹⁾ = Ex-protected version conforming to Equipment Group II, Category 3, G and D

Shaft runout

N = Standard, in conjunction with S1/M1 or S3/M3 encoder only

R = Reduced, linear movement conforming to DIN 42955, in conjunction with S2 or M2 encoder only

Holding brake

0 = Without holding brake

1 = With electr. released holding brake

2¹⁾ = With heavy-duty holding brake

3¹⁾ = With extra-heavy-duty holding brake

¹⁾ Only for certain sizes

All specifications relate to the basic version of the motor with encoder S1 and without holding brake

¹⁾ At 750 V DC bus voltage

²⁾ Values without/with holding brake

IndraDyn S – MKE servo motors for potentially explosive areas

The MKE range of motors are specifically designed for use in production plants where an explosive mixture of air and flammable gases, vapors, mist or dust can occur:

- Chemical industry
- Mining
- Printing shops
- Woodworking
- Paint shops
- Mills
- Food processing industry
- Refineries
- Tank farms, and much more

Within the broad range of torques up to a maximum of 87 Nm, there is a choice of various sizes of motor with flameproof enclosures. Needless to say, all are ATEX certified and/or UL/CSA compliant. These motors can also be supplied with a range of options – holding brake, keyway and single-turn or multi-turn encoder systems.

Internationally recognized certification

MKE motors have been certified as explosion-protected equipment by the German metrology institute providing scientific and technical services, the PTB Braunschweig, in accordance with Directive 94/9/EC.

With their flameproof enclosure, MKE motors are suitable for use in areas with flammable gases and vapors as specified in EN 60079-0/-1 (marking: II 2 G Ex d IIB T4) as well as flammable dusts as specified in EN 61241-0/-1 (marking: II 2 D Ex tD A21 IP6X T135°).

The certificates are recognized by all member states of the European Union as well as non-European members of the CENELEC.

MKE motors based on the American standard (UL/CSA) were certified directly by Underwriters Laboratories Inc. (UL) in the USA for use in areas with flammable gases, vapors and dusts in accordance with UL674 (marking: Class I Division 1 Groups C, D). MKE098 and MKE118 also have the marking Class II Division 1 Groups F, G.

MKE as per ATEX –
terminal box with Ex d
cable connectors

MKE as per UL/CSA –
terminal box with cables for
conduit installation

Ultra-safe

Maximum torques up to 190 Nm
Maximum speeds up to 9,000 rpm
Range of encoder systems
Explosion-proof enclosure
Compliance with ATEX and UL/CSA

All specifications relate to the basic version of the motor with encoder S1 and without holding brake

¹⁾ At 750 V DC bus voltage; ²⁾ Values without/with holding brake

The simple step-by-step guide to ordering your MKE servo motor:

MKE037B-144-AG0-BENN

Motor

Overall size (e.g. "037")
Overall length (e.g. "B")
Winding (e.g. "144")

Encoder

A = Single-turn encoder (HiPerface®), 128 signal periods
B¹⁾ = Single-turn encoder (EnDat), 2,048 signal periods
C = Multi-turn encoder (HiPerface®), 128 signal periods with 4,096 revolutions absolute
D¹⁾ = Multi-turn encoder (EnDat), 2,048 signal periods with 4,096 revolutions absolute

¹⁾ Not applicable to MKE037 and MKE047

Shaft

G = Plain shaft with shaft sealing ring
P = Keyway conforming to DIN 6885-1 and shaft sealing ring

Cable entry

4 = Ø 13 – 16 mm
6 = Ø 17 – 19.5 mm
N = Conforming to American standard (UL)

Housing design

E²⁾ = Conforming to European standard (ATEX)
N = Conforming to American standard (UL)

²⁾ Version E only available with power connection option B

Line terminal

A = On the A side
B = On the B side
L = Left
R = Right

Holding brake

0 = Without holding brake
1 = With electr. released holding brake

IndraDyn S – MSM servo motors for IndraDrive Cs

Maintenance-free MSM motors are available in five sizes rated at up to 750 W continuous mechanical power. These short-length motors feature high power density and minimized flange dimensions, making them the ideal choice in a wide range of application scenarios. The IP54 motors come with an absolute encoder and optional holding brake, and they can easily be connected to IndraDrive Cs power units with a 3 AC 230 V line input.

Buffer battery for absolute encoder function

A buffer battery is needed for permanent storage of the axis position.

A battery box which is simple to install is available as an accessory.

Order code: SUP-E01-MSM-BATTERYBOX

As an alternative, the buffer voltage can be supplied directly at the power unit via a special encoder connector with additional terminal connections.

This permits the use of a central battery or an uninterrupted power supply (UPS) as a voltage supply – e.g. for a package consisting of several drives.

Order no. for D-SUB encoder connector with buffer voltage connection: RGS0001/K01

Order no. for pre-assembled encoder cable with RGS001 connector: RKG0041

Dynamic and compact

Maximum torques up to 7.1 Nm
 Maximum speeds up to 5,000 rpm
 Multi-turn absolute encoder
 High dynamic performance
 High performance density

Motor	Rated power	Continuous torque at standstill	Maximum torque	Maximum speed	Moment of inertia	Dimensions								Weight ¹⁾
	P_N [W]	$M_{0.60k}$ [Nm]	M_{max} [Nm]	n_{max} [rpm]	J_R [kgm ²]	A [mm]	B ¹⁾ [mm]	C [mm]	Ø D [mm]	Ø E [mm]	Ø F [mm]	Ø G [mm]	H [mm]	[kg]

¹⁾ Values without/with holding brake

The simple step-by-step guide to ordering your MSM servo motor:

MSM 019 B-0300-NN-M0-CH 1

Size

019 = Flange 38 mm
 031 = Flange 60 mm
 041 = Flange 80 mm

Overall length (e.g. "B")

Winding

0300 = Nominal speed 3000 rpm

Cooling system

NN = Natural convection

Encoder

M0¹⁾ = Digital multi-turn absolute encoder with encoder resolution of 17 bits/revolution, 65,536 distinguishable revolutions

¹⁾ Absolute encoder function with external buffer battery

Holding brake

0 = Without holding brake
 1 = With electrically released holding brake

Shaft

H²⁾ = Plain shaft without shaft sealing ring
²⁾ Shaft sealing ring retrofit possible

Electrical connection

C = 220 mm cable

IndraDyn A – MAD air-cooled asynchronous servo motors

With their impressive power density, the MAD range of motors is predestined for servo and main spindle applications, such as in machine tools, printing presses or metal forming technology.

High-resolution single-turn or multi-turn encoder systems and outstanding true running quality guarantee highest handling precision. In addition to the optional keyway and holding brake, these motors can also be supplied with a special bearing assembly for high-speed applications or for applications with increased radial load.

The motor protection category IP65 even includes the fan motor, making it suitable for harsh industrial use.

The easy-maintenance design of the motor means that it is even possible to exchange the fan while the motor is running – particularly advantageous in the printing industry.

Robust and easy-maintenance

Rated outputs of up to 93 kW
 Maximum speeds up to 11,000 rpm
 Encoder systems for a wide and diverse range of applications
 High protection category IP65, including fan motor
 Easy-maintenance motor design

The simple step-by-step guide to ordering your MAD asynchronous servo motor:

MAD 100C-0100-SA-S2-A H 0-05-N 1

Motor

Size (e.g. "100")
 Overall length (e.g. "C")
 Winding (e.g. "0100")

Cooling system

SA = Axial-flow fan
SL = Fan cowl

Encoder

S2 = Single-turn encoder (EnDat) 2,048 signal periods
M2 = Multi-turn encoder (EnDat) 2,048 signal periods with 4,096 revolutions absolute
S6²⁾ = Single-turn encoder (EnDat) 2,048 signal periods for potentially explosive atmospheres
M6²⁾ = Multi-turn encoder (EnDat) 2,048 signal periods with 4,096 revolutions absolute for potentially explosive atmospheres
C0 = Incremental encoder, 2,048 increments

²⁾ Equipment group II 2G, type of protection EEx p d IIB T3 only in combination with fan cowl cooling option SL

Line terminal

Plug¹⁾

A = On the A side
B = On the B side
L = Left
R = Right

Terminal box turntable

E = On the A side
H = On the B side
G = Left
D = Right

¹⁾ Only for certain sizes

Vibration severity grade

1 = A
3¹⁾ = B
4¹⁾ = C

Bearing assembly

N = Standard
A¹⁾ = Fixed bearing A side
H¹⁾ = High-speed
V¹⁾ = Heavy duty

Construction

05 = Flange-mounted
35 = Flange-mounted or foot-mounted

Holding brake

0 = Without holding brake
1 = With electr. released holding brake
3¹⁾ = With electr. released holding brake, heavy duty
5¹⁾ = With electr. clamped holding brake

Shaft version e.g.

Plain shaft
H = Without seal ring
G = With seal ring (IP65)
F = With labyrinth seal
 Keyway
Q = Without seal ring
P = With seal ring (IP65)
R = With labyrinth seal

All the specifications given relate to the basic version of the motor without a holding brake. The maximum speed depends on the bearing version.

¹⁾ Motor height H for version with terminal box, the values for a power connection with plug can deviate and are as follows:

MAD100 = 260 mm, MAD130 = 338 mm, MAD160 = 393 mm

²⁾ Housing size > flange size A

IndraDyn A – MAF liquid-cooled asynchronous servo motors

The liquid-cooled motors in the MAF series are particularly suitable for applications demanding maximum torques in minimum amounts of space. At the same time the unique cooling system design ensures the thermal isolation of motor and machine and therefore maximum handling precision. The quick couplings with integrated leak-proofing simplify your maintenance work.

Options such as holding brakes, different encoder systems, vibration severity grades and shaft specifications allow you to tailor the MAF motors optimally to your specific application.

Compact and powerful

Rated outputs of up to 120 kW
 Maximum speeds up to 11,000 rpm
 Encoder systems for a wide and diverse range of applications
 High protection category IP65
 Liquid cooling with quick coupling

The simple step-by-step guide to ordering your MAF asynchronous servo motor:

All the specifications given relate to the basic version of the motor without a holding brake. The maximum speed depends on the bearing version.

¹⁾ Motor height H for version with terminal box, values for a power connection with plug can deviate and are as follows:

MAF100 = 260 mm, MAF130 = 338 mm, MAF160 = 393 mm

²⁾ Housing size > flange size A

IndraDyn L – MLF synchronous ironcore linear motors

Compact construction, high protection category and maximum forces of up to 21,500 N – these characteristics make the MLF synchronous linear motors well suited to meet the challenges posed by machine tools.

Given their low force ripple, the motors are particularly suitable for quickly transporting large masses in harsh environments. The motors are fully encapsulated in a stainless steel/titanium alloy sheet metal case, and they can be installed right in the machining area of machine tools.

There is a choice of sizes geared to typical requirements supplied in standard encapsulation or thermal encapsulation to minimize the heat that enters the machine. The combination of several linear motors – whether in series or parallel – gives rise to completely new machine concepts with greatly enhanced machining force.

All the specifications given are based on operation with liquid cooling and 540 V DC bus voltage.

IndraDyn L – MCL synchronous ironless linear motors

Ironless MCL linear motors position small masses with superior precision and maximum synchronization. Compared to iron core motors, these motors distinguish themselves with the ironless design of the primary part, which contains the fully potted three-phase copper winding. The U-shaped secondary part contains permanent magnets and encloses the primary part. This design means that there is no attraction or cogging force between the primary and secondary part and the force constant is linear. These aspects, combined with the relatively small moving masses of the primary part, create a high level of dynamics with a very high degree of precision.

The compact design features different mounting planes on primary and secondary parts, providing the highest flexibility in construction design. Optionally, the linear motors also come with a Hall sensor unit to detect the position for the initial commutation.

Typical areas in which ironless linear motors can be used are applications where it is important to move small masses at the maximum possible cycle speed with extremely high precision. That includes pick-and-place machines used in the semiconductor segment as well as those used in general automation processes. The exceptionally high synchronization of the MCL motors also makes them perfect for use in measuring and testing machines.

The simple step-by-step guide to ordering your IndraDyn L synchronous linear motor:

MCP 040C-V070-NI-N0 CN-NNNN	
Motor (primary part)	Hall sensor
Size (e.g. "040")	N0 = Without Hall sensor
Overall length (e.g. "C")	L0 = Digital Hall sensor
Winding (e.g. "070")	L1 = Analog Hall sensor
MCS 040-3S-0120-NNNN	
Motor (secondary part)	Segment length D
Size (e.g. "040")	For MCS015: 0120 = 120 mm
	0066 = 66 mm 0180 = 180 mm
	0099 = 99 mm 0300 = 300 mm

Linear motor without iron core

Maximum force of up to 1,700 N
 Maximum speeds of up to 1,400 m/min
 Excellent synchronization, no cogging forces
 Low own weight, high acceleration and dynamics
 Simple integration thanks to various mounting planes

All the specifications given are based on operation with 300 V DC bus voltage (with 48 V for MCL015) and an optimum thermal connection.

IndraDyn T – MBT synchronous torque motors

The IndraDyn T torque motors are liquid-cooled kit motors which have been optimized for high torques of up to 13,800 Nm. They consist of a stator with three-phase winding and a rotor with permanent magnets.

Typical areas of application for these motors mainly include direct drives in rotary tables or swivel axes in machining centers. However, they also offer innovative new approaches to solutions in mechanical engineering applications using robots, plastics processing machines, woodworking machines, lathes and special purpose machines.

The “cooling jacket” option on the MST stators consists of a closed-circuit cooling jacket, mounting flange and terminal box or plug. The rear side of the cooling jacket is open, and the rotor is attached to the machine shaft and mounting.

This solution features an optimal mix of standard solution and design freedom for the integration of direct-drive technology. Reduced design effort and service-friendly mounting offer substantial additional cost advantages.

The simple step-by-step guide to ordering your IndraDyn T torque motor:

MST 530B-0070-FT-N0 CN-NNNN

Stator

Motor (stator)

Size (e.g. “530”)
Overall length (e.g. “B”)
Winding (e.g. “0070”)

Liquid cooling system

FT = Open cooling jacket
FH = Closed cooling jacket in housing, flange-mounted

Electrical connection outlet

CN = Axial on side with larger Ø
SN = Axial on side with smaller Ø
RN¹⁾ = Radial on side with larger Ø
KR¹⁾ = Terminal box
PU¹⁾ = Plug, turnable

¹⁾ Depending on motor size

The simple step-by-step guide to ordering your IndraDyn T torque motor:

MRT 530B-3A-0410-NNNN

Rotor

Motor (rotor)

Size (e.g. “530”)
Overall length (e.g. “B”)

Internal diameter of rotor

The rotors can be supplied with different internal diameters.

Powerful and direct

Maximum torques up to 13,800 Nm
 Full torque even at standstill
 Extremely high overload capacity
 Optionally available with flange housing
 Easy assembly

All the specifications given are based on operation with liquid cooling and 540 V DC bus voltage.

¹⁾ Depends on rotor version; ²⁾ Stator/rotor on open cooling jacket version

IndraDyn H – MBS synchronous high-speed motors

The liquid-cooled high-speed IndraDyn H kit motors achieve maximum torques of up to 4,500 Nm with speeds of up to 30,000 rpm.

With their broad constant output power range, short ramp-up time and low rotor temperature they are predestined for motor spindles and other similar areas of application.

The new on board cooling system simplifies their integration in the machine and increases their cooling efficiency.

For extra easy assembly and disassembly we can supply the rotor on request with a step interference fit and the corresponding hydraulic connections.

The simple step-by-step guide to ordering your high-speed IndraDyn H motor:

MSS 182A-0100-FA-N0CN-NNNN

Stator

Motor (stator)

Size (e.g. "182")
Overall length (e.g. "A")
Winding (e.g. "0100")

The simple step-by-step guide to ordering your high-speed IndraDyn H motor:

MRS 182A-1N-0075-NNNN

Rotor

Motor (primary part)

Size (e.g. "182")
Overall length (e.g. "A")

Internal diameter of rotor

Corresponding internal diameters are available for every rotor size.
For further details see motor manual.

Rotor version

1N = Smooth bore
2N = Step interference fit with hydraulic connection

High dynamics and precision

Maximum torques of up to 4,500 Nm
 Maximum speeds up to 22,500 rpm
 Wide constant output power range
 Integrated cooling system
 Easy integration into the machine

1 MB – asynchronous high-speed motors

The liquid-cooled 1MB high-speed motors are maintenance-free asynchronous motors with high power density. For different performance requirements and installation situations, our product range offers 8 motor sizes with different overall lengths and diameters.

Typical areas of application of these motors are the main spindles of modern CNC machines and machining centers. These high-speed motors excel by their superb running smoothness and perfect servo quality for C-axis machining, thread cutting and spindle positioning.

The simple step-by-step guide to ordering your asynchronous high-speed motor 1MB:

1MS 310B-6B-A2 / S010

Stator

Motor (stator)

Size (e.g. "310")
Overall length (e.g. "B")
Winding (e.g. "6B")

Special version

S010 = With several integrated temperature sensors (NTC thermistor, PTC thermistor, temperature switch)

Electrical connection

1 = Lines at the stator side brought out with larger outside diameter
2 = Lines at the stator side brought out with smaller outside diameter

The simple step-by-step guide to ordering your asynchronous high-speed motor 1MB:

1MR 310B-A094

Rotor

Motor (primary part)

Size (e.g. "310")
Overall length (e.g. "B")

Internal diameter of rotor

For each rotor size, corresponding internal diameters are available.
For further details see motor manual.

Rotor version

E.g. step interference with hydraulic connection

Robust and reliable

Rated torques up to 875 Nm
Maximum speeds up to 20,000 rpm
Large spindle cutoff
Excellent running smoothness
Easy integration into the machine

Motor		Rated speed	Maximum speed	Rated torque	Rated power	Rated current	Moment of inertia (rotor)	Dimensions			Weight ²⁾
		n_N [rpm]	n_{max} [rpm]	M_N [Nm]	P_N [kW]	I_N [A]	J_R [kgm ²]	$\varnothing A$ [mm]	B [mm]	$\varnothing C^{1)}$ [mm]	m [kg]

All the specifications given are based on operation with liquid cooling and 540 V DC bus voltage.

¹⁾ Available diameters depend on rotor version ²⁾ Stator/rotor

GTE – standard planetary gearboxes

Together with our dynamic MSK motors, the compact GTE range of planetary gearboxes guarantees high torques in all standard applications.

Typical areas of application include simple handling and automation systems with rack-and-pinion drives or synchronous belt drives.

Virtually all performance requirements can be met in these applications thanks to the subtle staggering of sizes and the high power density of the GTE gearboxes.

The single-stage or two-stage gearboxes can be supplied with a plain shaft or keyway.

The simple step-by-step guide to ordering your GTE planetary gearboxes:

GTE 060-NN 1-004 A-NN03

Gears

Size (e.g. "040")

Gear range

¹⁾ These values refer to an output shaft speed of 100 rpm on duty cycle KA = 1 as well as S1 mode for electrical machines and T = 30°C

²⁾ Depends on the motor shaft diameter

³⁾ With key, at tumescent load

⁴⁾ Permissible for 30,000 output shaft revolutions

⁵⁾ Depends on ratio, for output shaft speed = 100 rpm

⁶⁾ Permissible operating temperature must be observed

GTM – high-precision planetary gearboxes

Characterized by a particularly high power density and low backlash, the high-precision GTM range of planetary gearboxes has been designed for mounting directly on servo motors.

Their high degree of efficiency makes these gearboxes suitable for the S1 continuous operation and therefore ideal for use in printing presses, for example.

Combined with the dynamic IndraDyn motors they achieve the highest speeds, acceleration and optimum positioning accuracy.

The single-stage or two-stage gearboxes can be supplied with a plain shaft or keyway and also with reduced backlash on request.

The simple step-by-step guide to ordering your GTM planetary gearbox:

GTM 075-NN 1-004 A-NN03

Standard and geared motors – for simple applications

For use with frequency converters we recommend combining IndraDrive with geared motors or three-phase asynchronous motors made by NORD Drive Systems or VEM Motors.

Upon request we can supply all-in-one solutions, comprising of control units and motors also sourced directly from Rexroth.

Our range of geared motors covers various types of gears of different performance categories:

- Spur gear motors with rated outputs of up to 160 kW and torques of up to 26,000 Nm
- Offset geared motors with rated outputs of up to 200 kW and torques of up to 200,000 Nm
- Bevel gear motors with rated outputs of up to 160 kW and torques of up to 32,000 Nm
- Worm gear motors with rated outputs of up to 15 kW and torques of up to 3,000 Nm

Our range of three-phase asynchronous motors includes:
Standard motors with rated outputs of up to 500 kW
Energy-saving motors with rated outputs of up to 335 kW

These motors are particularly suitable for operation with frequency converters and boast the following features:

- Motor design conforming to DIN EN 60034 (IEC 72)
- Mounting dimensions and output correlation compliant with DIN 42673, 42677
- Robust, low-vibration version in gray cast iron
- Protection category IP55, higher protection category up to IP65 optional
- Insulation class F with thermal reserve, insulation class H optional
- Further options include brakes, encoders, position of terminal box, etc.

The examples apply to the operation of 4-pole standard motors at a 4 kHz switching frequency and a rotary frequency > 4 Hz. The power data in kW apply to a voltage of 3 AC 400 V/50 Hz and the power data in hp apply to a voltage of 3 AC 460 V/60 Hz. Either a mains choke or a DC choke is required when operating an HCS04 inverter.

Auxiliary components

Accessories for all requirements

Filters and chokes for EMC-proof operation
 Components designed to absorb high braking forces
 Energy storage capacitors for dynamic sequences
 Accessories for simplified assembly and installation

Mains filters

Mains filters with integrated mains choke

Mains chokes

DC chokes

Motor filters

Brake choppers

Brake resistors

Brake units

Capacity modules

Blower unit

Other accessories

Basic accessories for assembly and installation
 Shield connection for EMC-compatible connection of the motor cable to the power unit
 Control cabinet adapter for combining control units of different depths
 Auxiliary capacitor
 Electrical adaptors
 Flange assembly kit
 Control cabinet assembly kit
 Modular bus extension to bridge larger distances between drive groups

Mains filters – for HMV power supply units and HCS converters

Mains filters ensure that the EMC limit values are adhered to and suppress leakage current generated by line capacitors. Our mains filters are optimally coordinated with the power units and are scalable in regards to current, number of drives and motor cable length. They can be combined with our shielded motor cables for trouble-free operation conforming to EN 61800-3, Class A, Group 2, even with single cable lengths of up to 75 m.

All data apply to nominal rating at 3 AC 400 V mains voltage. Please see the selection tables on the end of this chapter for exact assignments to the power units.

Mains chokes – for HMV power supply units and HCS converters

In connection with the mains chokes, converters and infeed power supply units realize higher DC bus continuous power. They reduce the harmonics in the line current while simultaneously preventing circuit feedback.

When using supply units with line regeneration, these components are always required.

This combination always complies to the permissible EMC values for industrial networks stipulated by EN 61000-2-4.

¹⁾ With integrated fan, supply voltage DC 24 V

DC chokes – for HCS04 converters

HCS04 converters used with HLL DC chokes achieve higher continuous power in the DC bus.

They reduce the harmonics in the line current while simultaneously preventing circuit feedback.

These chokes are always required when the HCS04 converters are used in residential areas.

All data apply to nominal rating at 3 AC 400 V mains voltage.

Please see the selection tables on the end of this chapter for exact assignments to the power units.

Motor filters – for HCS converters

The combination of the steep switching curves of modern converters and long motor wires can often cause transient overvoltages on the motor terminals. This, along with the leakage current of the motor wires, can be reduced by using a motor filter on the inverter output.

This provides the following advantages:

- Voltage rise limited to values below 1 kV/μs
- Winding insulation protected by limiting the voltage peak to max. 1,000 V
- Operation of several motors connected in parallel on one frequency converter via long supply lines
- Compliance with increased EMC requirements thanks to reduced interference voltages

All data apply to nominal rating at 3 AC 400 V mains voltage and 4 kHz clock frequency. The maximum output frequency is 200 Hz. Please see the selection tables on the end of this chapter for exact assignments to the power units.

Brake choppers – for HCS04 converters

Brake choppers are used together with an external braking resistor to increase the braking power.
The HLT brake chopper is controlled and monitored by the HCS04 converter.

Brake choppers	Braking power				Power dissipation	Width W	Height H	Depth D	Weight

Please see the selection tables on the end of this chapter for exact assignments to the power units.

Brake resistors – for HCS converters

When using the HCS03 converters in regenerative operation there is a choice of particularly compact brake resistors for various different levels of power consumption. The brake resistor is mounted directly above the converter. This space-saving arrangement also simplifies the installation work. At the same time the converter's extracted air flow makes an effective cooling system. The robust construction and high dielectric strength of the resistor elements enables high power and impulse loading. The resistor elements are flameproof and are protected from harmful environmental factors by their full encapsulation.

Please see the selection tables on the end of this chapter for exact assignments to the power units.

Brake resistors – for HCS converters in heavy-duty version

The heavy-duty version of the brake resistor must always be used in applications where high regeneration occurs over a relatively long period of time. This is the case, for example, when lowering large loads or when braking high mass moments of inertia.

Depending on the braking power required there is a choice of compact brake resistors of different power levels and designs for each converter.

Please see the selection tables on the end of this chapter for exact assignments to the power units.

Brake units – for HMV power supply units and HCS converters

The connection of brake units increases the continuous and peak regenerative power.
The brake unit also makes it possible to have the DC bus short circuit function available in the drive system.
This function makes it possible to brake the synchronous motors even in the event of a power failure.

Brake unit	Maximum energy consumption	Braking power				Width W	Height H	Depth D	Weight
		Duration	Max.	t _{on time}	t _{cycle time}				
	[kW]	[kW]	[kW]	[s]	[s]	[mm]	[mm]	[mm]	[kg]

HLB01.1D-02K0-N03R4-A-007-NNNN	500	2	100	1	250	100	440	309	12.2

Please see the selection tables on the end of this chapter for exact assignments to the power units.

Capacity modules – for HMV power supply units and HCS converters

Capacity modules improve the energy balance in applications where machining cycles take place in rapid succession, such as roll feeds or cross cutting lines. Connected to the DC bus, the capacity modules act as a temporary energy storage unit and reduce the heat loss in the control cabinet by relieving the braking resistor. In the event of a power failure the reserve energy enables a controlled retraction motion. This protects the workpiece and the tool, e.g. in gear cutting machines.

Capacity modules	Capacitance	Width W	Height H	Depth D	Weight
	[mF]	[mm]	[mm]	[mm]	[kg]
HLC01.1C-01M0-A-007-NNNN	1	50	352	251.5	3.2

HLC01.1D-05M0-A-007-NNNN	5	75	440	309	8.6

Please see the selection tables on the end of this chapter for exact assignments to the power units.

Blower units – for HMOV supply units and HMS inverters

The blower unit HAB01 is required for operating the supply unit HMOV01.1R-W0120 and the inverter HMS01.1N-W0350. In a space-saving arrangement, it is mounted directly below the unit. The electrical connection is made via a simple plug-in connector.

Blower unit	Width W	Height H	Depth D	Weight
	[mm]	[mm]	[mm]	[kg]
HAB01.1-0350-1640-NN	350	308	152	7.5

Other accessories

Basic accessories HAS01

The basic accessories contain all the mounting parts and fixing elements. Depending on the application, we supply these accessories complete with all the connecting bars for control voltage and DC bus.

Shield connection HAS02

The shield connection plate is an EMC-compatible method of connecting the motor cable to your control unit. It also serves as a cord grip.

Control cabinet adapter HAS03

The control cabinet adapters are used to combine HCS02 converters and their auxiliary components with units from the IndraDrive M series. Spacer bolts even out the lower unit depth thus creating an even frontage with a uniform installation height.

Auxiliary capacitor HAS04

Use the additional capacitor HAS04 to operate HCS02 and HCS03 inverters with an HNF mains filter even if the minimum number of attached control units is not reached.

Flange assembly kit HAS07

In the case of HCS04 converters which are installed with the HAS07 flange-mounting kit, the heat sinks are located outside the control cabinet. This reduces the air conditioning of the control cabinet interior to a minimum.

Control cabinet assembly kit HAS08

This assembly kit makes it easy to install the HCS04 converter in a Rittal TS8 control cabinet.

Module bus extension RKB0001

All the control units are fitted with a bus cable to transmit the control signals. Where there are relatively large distances between individual control units we can supply the necessary module bus extensions, in various lengths ranging from 0.5 m to 40 m.

Electrical adapters HAS05

HAS05.1-001	Use the HAS05.1-001 adapter to connect a HNK mains filter or a HMF motor filter to an HCS03.1E-W0070 converter.
HAS05.1-002	If you install both a mains filter and motor filter, please use the HAS05.1-002-NNN-NN adapter.
HAS05.1-003	You can use the HAS05.1-003 signal level converter to adjust the voltage level (5 – 30 V) of the encoder emulation signals to your application. The signal level converter is connected to the D-SUB connector of the control unit.
HAS05.1-004	You can use the HAS05.1-004 DC bus adapter to supply power to inverter units without using the standard connecting bars. Cables with a cross-section of up to 2 x 50 mm ² per phase can be used.
HAS05.1-005	The HAS05.1-005 interface converter enables you to add RS485 connectivity to your IndraDrive. Pre-assembled cables are available to connect the level converter to the RS232 port of the control unit. The converters can either be clipped on to a DIN rail or attached directly to the mounting plate.

Notes: 12/280 = mains filter for up to 12 drives and a maximum motor cable length of 280 m. These values must be reviewed for each application.

Additional components may be necessary. Regardless of the number of axes, the effective total mains current must not exceed the maximum current rating of the mains filter.

The maximum length might be different in case of open-loop mode or when using unshielded cables.

¹⁾ Recommended values for group supply without DC bus connection, the maximum cable length for single drives is 75 m.

²⁾ Recommended values for central supply: one inverter supplies power to other inverters, the maximum cable length for single drives is 75 m.

³⁾ 2 mains filters HNF are required for operation.

These tables are an extract from our extensive range of cables. Cables for other motors can be found in our documentation entitled "Connection cables – selection data".

All specifications given apply to motors with natural convection at 60K.
Standard encoder cable RKG4200 for all motors.

1) For surface-cooled motor

Glossary

A

ADVANCED

Control units for maximum performance and dynamics with many configuration options

B

BASIC

Control units for standard applications

Basic accessories

All the mounting parts and hardware, and the connecting bars for the control voltage and DC bus

Brake chopper

Brake transistor

Transistor which switches a brake resistor on and off

Braking power

Power which is recovered in regenerative operation of the motors

Brake resistor

For input power in regenerative operation (converted into heat)

Brake unit

All-in-one unit comprising brake resistor and braking transistor (brake chopper) used to increase the braking power

C

Capacity module

Optional auxiliary component to store energy in the DC bus

CLOSED LOOP

Closed control loop (automatically regulated operation) in which the device being regulated is monitored using a measuring system and made available to the drive

Control cabinet adapter

Spacer bolts used to even out different unit depths

Control unit

The part of the drive unit comprising all the control functions and interfaces for installation in the power unit

Converter

Takes the mains voltage with its fixed amplitude and frequency and generates a three-phase alternating current with variable amplitude and frequency

D

DC bus voltage

DC voltage generated from the AC network and used to supply the power units

Derating

Lowering of the specified data in the event of a change in operating conditions

Drive unit

Converter and inverter consisting of a power and a control unit, for the control of servo and standard motors.

E

EMC

Electromagnetic compatibility

Encoder cable

Cable used to connect the motor encoder to the encoder interface of the control unit

F

Firmware

Device-specific software for the drive functions

Functions library

Collection of function blocks conforming to IEC or PLCopen

I

IndraDrive C

Compact drive series, converters

IndraDrive Cs

Ultra-compact, multi-protocol-capable drive series, inverters

IndraDrive M

Modular drive series, inverters and power supply units

IndraDrive Mi

Distributed drive series – inverter, control unit and synchronous servo motor in one unit

IndraDyn A

Air-cooled or liquid-cooled asynchronous servo motors

IndraDyn H

High-speed frameless (kit) motors

IndraDyn L

Synchronous linear motors

IndraDyn S

Synchronous servo motors, also for potentially explosive areas

IndraDyn T

Synchronous frameless (kit) torque motors

IndraMotion MLD

Integrated automation solution comprising drive functions, motion control and processing logic

IndraSize

Software tool used for sizing and selecting drives based on the machine data

IndraWorks

Engineering framework toolkit for project planning, parameterization, start-up, diagnostics, etc.

Inverter

Takes the DC bus voltage and generates a three-phase alternating current with variable amplitude and frequency

M**Mains choke**

Used to increase the continuous DC bus output and to suppress harmonics

Mains filter

EMC filter for power supply units and converters used to reduce circuit feedback

Module bus

Bus connection between power units for exchanging internal control signals

Module bus extension

Optional bus connection used to bridge larger than average distances between individual drive control units

Motion logic

Integrated automation solution comprising drive functions, motion control and processing logic

Motor filter

Used to protect the motor winding from extreme voltage rises

O**OPEN LOOP**

Open control loop (controlled operation) in which the device being controlled is not monitored using measuring techniques

P**Power cable**

Cable for connecting the motor to the power unit

Power recovery

Return of energy to the mains supply during regenerative operation of the drive

Power supply unit

Takes the mains voltage with fixed amplitude and frequency and generates a DC bus voltage

Power unit

The part of the drive control unit containing the power electronics to control the motors, used to hold the control unit

S**Safety on Board**

Safety technology integrated in the drive, certified in accordance with EN 13849-1 and EN 62061

Shield connection

Connection plate for EMC-compatible connection of the motor cable to the control unit

Software module

MultiMedia Card for simple transmission of axis-oriented drive parameters without the use of a PC

Switching frequency

Clock frequency of the pulse width modulation (PWM)

T**Technology package**

Process-oriented function blocks, e.g. tension control

U**User library**

Collection of function blocks developed by the user

User program

Application-specific combination of different function blocks/technology packages

Formulas

	Speed	Torque	Output	Mass moment of inertia
Roller, wheel, pinion and belt drive 	$n = \frac{v}{2 \cdot r \cdot \pi}$	$M = F \cdot r$	$P = \frac{F \cdot v}{60}$	$J = m \cdot r^2$
Ball screw drive 	$n = \frac{v \cdot 1000}{h}$	$M = \frac{F \cdot h}{2 \cdot \pi \cdot 1000}$	$P = \frac{F \cdot v}{60}$	$J = m \cdot \left(\frac{h}{2 \cdot \pi \cdot 1000} \right)^2$
Pulley drive 	$n = \frac{v}{2 \cdot \pi \cdot r}$	$M = m \cdot g \cdot r$	$P = \frac{m \cdot g \cdot v}{60}$	$J = m \cdot r^2$
	Speed	Torque	Transmission ratio	Mass moment of inertia
Gear conversion 	$n_1 = n_2 \cdot i$	$M_1 = \frac{M_2}{i}$	$i = \frac{n_1}{n_2}$	$J = \frac{J_2}{J_1}$

Miscellaneous

Rotational frequency	$\omega = \frac{2 \cdot \pi \cdot n}{60}$	Effective electrical power	$P = U \cdot I \cdot \cos \cdot \sqrt{3}$
Rotational kinetic energy	$W = \frac{J \cdot v^2}{2}$	Apparent electrical power	$S = U \cdot I \cdot \sqrt{3}$
Translational kinetic energy	$W = \frac{m}{2} \cdot \frac{(v)}{(60)}^2$	Reactive electrical power	$Q = U \cdot I \cdot \sin \cdot \sqrt{3}$
Synchronous rpm	$n = \frac{f \cdot 60}{p}$	DC bus voltage	$U = U_{\text{Netz}} \cdot \sqrt{2}$
Synchronous speed	$v = 2 \cdot f \cdot r_p$	Force	$F = m \cdot a$

Unit conversion

Physical value	Name of unit	Conversion	Name of unit
Force	pound-force	1 lbf = 4.4482 N	Newton
Power	horsepower	1 hp = 745.7 W	Watt
Length	inch	1 in = 25.4 mm	millimeter
Length	foot	1 ft = 0.3048 m	meter
Weight	pound	1 lb = 0.4536 kg	kilogram

Legend

a – Acceleration [ms ⁻²]	J – Mass moment of inertia [kgm ²]	r – Radius [m]
F – Force [N]	M – Torque [Nm]	S – Apparent power [VA]
f – Frequency [s ⁻¹]	m – Weight [kg]	U – Voltage [V]
g – Gravitational acceleration [9.81 ms ⁻²]	n – Rotational speed [rpm]	v – Speed [m/min]
h – Spindle pitch [mm]	P – Power [W]	W – Energy [Ws]
I – Current [A]	p – Pole pair number	τ _p – Pole pitch
i – Transmission ratio	Q – Reactive power [var]	ω – Rotational frequency [s ⁻¹]
